## Simplicial localization

$D$ Imagine $\mu$ is on $\left(\begin{array}{c}{\left[\begin{array}{c}n] \\ k\end{array}\right)} \\ \hline\end{array}\{0,1\}^{n}\right.$.

## Simplicial localization

$D$ Imagine $\mu$ is on $\binom{[\mathrm{n}]}{\mathrm{k}} \hookrightarrow\{0,1\}^{\mathrm{n}}$.
$\bigcirc$ Denote $p_{i}=\mathbb{P}_{S \sim \mu}[i \in S]$. Let us choose $i \sim \mu D_{k \rightarrow 1}=p / k$.

## Simplicial localization

$D$ Imagine $\mu$ is on $\left(\begin{array}{c}{\left[\begin{array}{c}n] \\ k\end{array}\right) \hookrightarrow\{0,1\}^{n} \text {. } \text {. } \text {. }} \\ \text {. }\end{array}\right.$
$\triangle$ Denote $p_{i}=\mathbb{P}_{S \sim \mu}[i \in S]$. Let us choose $i \sim \mu D_{k \rightarrow 1}=p / k$.
$D$ Let $y$ be the conditional on $\{i\}$. For $w=\mathbb{1}_{\mathfrak{i}} / \mathfrak{p}_{\boldsymbol{i}}-\mathbb{1} / \mathrm{k}$ :
a random measure

$$
v(x)=\underbrace{(1+\langle w, x-\operatorname{mean}(\mu)\rangle)}_{\text {linear tilt }} \mu(x)
$$

## Simplicial localization

$\triangle$ Denote $p_{i}=\mathbb{P}_{S \sim \mu}[i \in S]$. Let us choose $i \sim \mu D_{k \rightarrow 1}=p / k$.
$D$ Let $y$ be the conditional on $\{i\}$. For $w=\mathbb{1}_{\mathfrak{i}} / \mathfrak{p}_{\boldsymbol{i}}-\mathbb{1} / \mathrm{k}$ :
a random measure

$$
v(x)=\underbrace{(1+\langle w, x-\operatorname{mean}(\mu)\rangle)}_{\text {linear tilt }} \mu(x)
$$

$\bigcirc$ Note that $\mu=\mathbb{E}_{i}[\imath]$. This is a decomposition of measure.

## Simplicial localization

$\triangle$ Denote $p_{i}=\mathbb{P}_{S \sim \mu}[i \in S]$. Let us choose $i \sim \mu D_{k \rightarrow 1}=p / k$.
$\bigcirc$ Let $\gamma$ be the conditional on $\{i\}$. For $w=\mathbb{1}_{\mathfrak{i}} / \mathfrak{p}_{\mathfrak{i}}-\mathbb{1} / \mathrm{k}$ :
a random measure

$$
v(x)=\underbrace{(1+\langle w, x-\operatorname{mean}(\mu)\rangle)}_{\text {linear tilt }} \mu(x)
$$

$\triangleright$ Note that $\mu=\mathbb{E}_{i}[v]$. This is a decomposition of measure.
$\bigcirc$ Continuing this we get a measure-valued random process: $\leftarrow$ martingale

## Simplicial localization

$\bigcirc$ Imagine $\mu$ is on $\left(\begin{array}{c}{\left[\begin{array}{c}n] \\ k\end{array}\right)} \\ \hline\end{array}\{0,1\}^{n}\right.$.
$D$ Denote $p_{i}=\mathbb{P}_{S \sim \mu}[i \in S]$. Let us choose $i \sim \mu D_{k \rightarrow 1}=p / k$.
$D$ Let $\gamma$ be the conditional on $\{i\}$. For $w=\mathbb{1}_{\mathfrak{i}} / p_{i}-\mathbb{1} / \mathrm{k}$ :
a random measure

$$
v(x)=\underbrace{(1+\langle w, x-\operatorname{mean}(\mu)\rangle)}_{\text {linear tilt }} \mu(x)
$$

$\checkmark$ Note that $\mu=\mathbb{E}_{\mathfrak{i}}[v]$. This is a decomposition of measure.
D Continuing this we get a measure-valued random process: $\leftarrow$ martingale

## Simplicial localization

Let $S \sim \mu$, and let $e_{1}, \ldots, e_{k}$ be a u.r. permutation of
S. Define $\mu_{i}$ as conditional of $\mu$ on $\left\{e_{1}, \ldots, e_{i}\right\}$. Then

$$
\mu=\mu_{0} \rightarrow \mu_{1} \rightarrow \mu_{2} \rightarrow \cdots \rightarrow \mu_{\mathrm{k}}
$$

is called simplicial localization $\longleftarrow$ used for local-to-global and trickle down

## Stochastic localization

- Same idea applied in continuous time. For some measure $\mu$ on $\mathbb{R}^{n}$, we get measure-valued process $\left\{\mu_{\mathrm{t}} \mid \mathrm{t} \in \mathbb{R} \geqslant 0\right\}$.

## Stochastic localization

$\bigcirc$ Same idea applied in continuous time. For some measure $\mu$ on $\mathbb{R}^{n}$, we get measure-valued process $\left\{\mu_{\mathrm{t}} \mid \mathrm{t} \in \mathbb{R} \geqslant 0\right\}$.
$\bigcirc$ Controlled by (stochastic) differential equation

$$
\mathrm{d} \mu_{\mathrm{t}}(x)=\underbrace{\left\langle w_{\mathrm{t}}, x-\operatorname{mean}(\mu)\right\rangle}_{\text {linear tilt }} \mu_{\mathrm{t}}(x)
$$

where now $w_{\mathrm{t}}$ is a mean zero random infinitesimal vector.
think of infinitesimal Gaussian

## Stochastic localization

$\bigcirc$ Same idea applied in continuous time. For some measure $\mu$ on $\mathbb{R}^{n}$, we get measure-valued process $\left\{\mu_{\mathrm{t}} \mid \mathrm{t} \in \mathbb{R} \geqslant 0\right\}$.
$\bigcirc$ Controlled by (stochastic) differential equation

$$
\mathrm{d} \mu_{\mathrm{t}}(x)=\underbrace{\left\langle w_{\mathrm{t}}, x-\operatorname{mean}(\mu)\right\rangle}_{\text {linear tilt }} \mu_{\mathrm{t}}(x)
$$

where now $w_{\mathrm{t}}$ is a mean zero random infinitesimal vector.
think of infinitesimal Gaussian
$\bigcirc$ Our goal will be to find analogs of local-to-global, etc. for more general, e.g., continuous, distributions.

## Stochastic localization

$\bigcirc$ Same idea applied in continuous time. For some measure $\mu$ on $\mathbb{R}^{n}$, we get measure-valued process $\left\{\mu_{\mathrm{t}} \mid \mathrm{t} \in \mathbb{R} \geqslant 0\right\}$.
$\checkmark$ Controlled by (stochastic) differential equation

$$
\mathrm{d} \mu_{\mathrm{t}}(x)=\underbrace{\left\langle w_{\mathrm{t}}, x-\operatorname{mean}(\mu)\right\rangle}_{\text {linear tilt }} \mu_{\mathrm{t}}(x)
$$

where now $w_{\mathrm{t}}$ is a mean zero random infinitesimal vector.
$D$ Our goal will be to find analogs of local-to-global, etc. for more general, e.g., continuous, distributions.
$D$ To make sense of this equation, we need some basics of Itô calculus.

## Intro to Itô calculus

$D$ Brownian motion: in $n D$, the process $\left\{\mathrm{B}_{\mathrm{t}} \mid \mathrm{t} \in \mathbb{R}_{\geqslant 0}^{n}\right\}$ such that

$$
\mathrm{B}_{\mathrm{t}}-\mathrm{B}_{\mathrm{s}} \sim \mathcal{N}(0,(\mathrm{t}-\mathrm{s}) \mathrm{I})
$$

and for disjoint $\left[s_{1}, t_{1}\right], \ldots,\left[s_{k}, t_{k}\right]$ we have $B_{t_{i}}-B_{s_{i}}$ are independent.

## Intro to Itô calculus

$D$ Brownian motion: in $n D$, the process $\left\{B_{t} \mid t \in \mathbb{R}_{\geqslant 0}^{n}\right\}$ such that

$$
\mathrm{B}_{\mathrm{t}}-\mathrm{B}_{\mathrm{s}} \sim \mathcal{N}(0,(\mathrm{t}-\mathrm{s}) \mathrm{I})
$$

and for disjoint $\left[s_{1}, t_{1}\right], \ldots,\left[s_{k}, t_{k}\right]$ we have $B_{t_{i}}-B_{s_{i}}$ are independent.

$D$ We think of $\mathrm{dB}_{\mathrm{t}}$ intuitively as $\mathrm{B}_{\mathrm{t}+\mathrm{dt}}-\mathrm{B}_{\mathrm{t}}: \mathrm{dB}_{\mathrm{t}} \sim \mathcal{N}(0, \mathrm{dt} \cdot \mathrm{I})$

## Intro to Itô calculus

$D$ Brownian motion: in $n D$, the process $\left\{B_{t} \mid t \in \mathbb{R}_{\geqslant 0}^{n}\right\}$ such that

$$
\mathrm{B}_{\mathrm{t}}-\mathrm{B}_{\mathrm{s}} \sim \mathcal{N}(0,(\mathrm{t}-\mathrm{s}) \mathrm{I})
$$

and for disjoint $\left[s_{1}, t_{1}\right], \ldots,\left[s_{k}, t_{k}\right]$ we have $B_{t_{i}}-B_{s_{i}}$ are independent.

$D$ We think of $d B_{t}$ intuitively as $B_{t+d t}-B_{t}: \mathrm{dB}_{\mathrm{t}} \sim \mathcal{N}(0, d t \cdot I)$
$D$ Fact: $d B_{t}$ is not on the order of $d t$, but rather on the order of $\sqrt{d t}$ !

## Intro to Itô calculus

$D$ Brownian motion: in $n D$, the process $\left\{B_{t} \mid t \in \mathbb{R}_{\geqslant 0}^{n}\right\}$ such that

$$
\mathrm{B}_{\mathrm{t}}-\mathrm{B}_{\mathrm{s}} \sim \mathcal{N}(0,(\mathrm{t}-\mathrm{s}) \mathrm{I})
$$

and for disjoint $\left[s_{1}, t_{1}\right], \ldots,\left[s_{k}, t_{k}\right]$ we have $B_{t_{i}}-B_{s_{i}}$ are independent.

$D$ We think of $\mathrm{dB}_{\mathrm{t}}$ intuitively as $\mathrm{B}_{\mathrm{t}+\mathrm{dt}}-\mathrm{B}_{\mathrm{t}}: \mathrm{dB}_{\mathrm{t}} \sim \mathcal{N}(0, \mathrm{dt} \cdot \mathrm{I})$
$D$ Fact: $\mathrm{dB}_{\mathrm{t}}$ is not on the order of dt , but rather on the order of $\sqrt{\mathrm{dt}}$ !
$D$ Itô process: $\left\{X_{t} \mid t \in \mathbb{R} \geqslant 0\right\}$ derived via stochastic differential equation (SDE):

$$
\mathrm{d} \mathrm{X}_{\mathrm{t}}=\mathrm{u}_{\mathrm{t}} \mathrm{dt}+\mathrm{C}_{\mathrm{t}} \mathrm{~dB}_{\mathrm{t}}
$$

for some "nice" vector and matrix valued processes $\left\{u_{t}\right\},\left\{C_{t}\right\}$.

## Intro to Itô calculus

$D$ Brownian motion: in $n D$, the process $\left\{B_{t} \mid t \in \mathbb{R}_{\geqslant 0}^{n}\right\}$ such that

$$
\mathrm{B}_{\mathrm{t}}-\mathrm{B}_{\mathrm{s}} \sim \mathcal{N}(0,(\mathrm{t}-\mathrm{s}) \mathrm{I})
$$

and for disjoint $\left[s_{1}, t_{1}\right], \ldots,\left[s_{k}, t_{k}\right]$ we have $B_{t_{i}}-B_{s_{i}}$ are independent.

$D$ We think of $d B_{t}$ intuitively as $B_{t+d t}-B_{t}: d B_{t} \sim \mathcal{N}(0, d t \cdot I)$
$D$ Fact: $d B_{t}$ is not on the order of $d t$, but rather on the order of $\sqrt{d t}$ !
$D$ Itô process: $\left\{X_{t} \mid t \in \mathbb{R}_{\geqslant 0}\right\}$ derived via stochastic differential equation (SDE):

$$
\mathrm{d} X_{t}=u_{t} d t+C_{t} \mathrm{~dB}_{\mathrm{t}}
$$

for some "nice" vector and matrix valued processes $\left\{u_{t}\right\},\left\{C_{t}\right\}$.
$D u_{t}, C_{t}$ can only depend on the past; technical term: adapted.

## Itô formula

$D$ Basic question: if we have 1D Itô process $X_{t}$ defined by

$$
d X_{t}=u_{t} d t+c_{t} d B_{t}
$$

and define $Y_{t}=f\left(X_{t}\right)$, what is the equation defining $Y_{t}$ ?

## Itô formula

$D$ Basic question: if we have 1D Itô process $X_{t}$ defined by

$$
d X_{t}=u_{t} d t+c_{t} d B_{t}
$$

and define $Y_{t}=f\left(X_{t}\right)$, what is the equation defining $Y_{t}$ ?
$D$ Incorrect: if we apply chain rule of calculus, we get

$$
d Y_{t}=f^{\prime}\left(X_{t}\right) d X_{t}=f^{\prime}\left(X_{t}\right) u_{t} d t+f^{\prime}\left(X_{t}\right) c_{t} d B_{t}
$$

## Itô formula

$D$ Basic question: if we have 1D Itô process $X_{t}$ defined by

$$
d X_{t}=u_{t} d t+c_{t} d B_{t}
$$

and define $Y_{t}=f\left(X_{t}\right)$, what is the equation defining $Y_{t}$ ?
$D$ Incorrect: if we apply chain rule of calculus, we get

$$
d Y_{t}=f^{\prime}\left(X_{t}\right) d X_{t}=f^{\prime}\left(X_{t}\right) u_{t} d t+f^{\prime}\left(X_{t}\right) c_{t} d B_{t}
$$

$\bigcirc$ This is incorrect because $d Y_{t}=f^{\prime}\left(X_{t}\right) d X_{t}$ is only first-order approximation of $f$, and $d X_{t}$ has terms of order $\sqrt{\mathrm{dt}}$ !

## Itô formula

$D$ Basic question: if we have 1D Itô process $X_{t}$ defined by

$$
d X_{t}=u_{t} d t+c_{t} d B_{t}
$$

and define $Y_{t}=f\left(X_{t}\right)$, what is the equation defining $Y_{t}$ ?
$D$ Incorrect: if we apply chain rule of calculus, we get

$$
d Y_{t}=f^{\prime}\left(X_{t}\right) d X_{t}=f^{\prime}\left(X_{t}\right) u_{t} d t+f^{\prime}\left(X_{t}\right) c_{t} d B_{t}
$$

$\bigcirc$ This is incorrect because $d Y_{t}=f^{\prime}\left(X_{t}\right) d X_{t}$ is only first-order approximation of $f$, and $d X_{t}$ has terms of order $\sqrt{\mathrm{dt}}$ !
$D$ Correction: expand up to second-order Taylor series, and use $\mathrm{dB}_{\mathrm{t}}^{2}=\mathrm{dt}$, also drop anything of lower order than dt .

## Itô formula

$D$ Basic question: if we have 1D Itô process $X_{t}$ defined by

$$
d X_{t}=u_{t} d t+c_{t} d B_{t}
$$

and define $Y_{t}=f\left(X_{t}\right)$, what is the equation defining $Y_{t}$ ?
$D$ Incorrect: if we apply chain rule of calculus, we get

$$
d Y_{t}=f^{\prime}\left(X_{t}\right) d X_{t}=f^{\prime}\left(X_{t}\right) u_{t} d t+f^{\prime}\left(X_{t}\right) c_{t} d B_{t}
$$

$D$ This is incorrect because $d Y_{t}=f^{\prime}\left(X_{t}\right) d X_{t}$ is only first-order approximation of $f$, and $d X_{t}$ has terms of order $\sqrt{\mathrm{dt}}$ !
$D$ Correction: expand up to second-order Taylor series, and use $\mathrm{dB}_{\mathrm{t}}^{2}=\mathrm{dt}$, also drop anything of lower order than dt .
D This gives us the Itô formula:

$$
d Y_{t}=(f^{\prime}\left(X_{t}\right) u_{t}+\underbrace{\frac{1}{2} f^{\prime \prime}\left(X_{t}\right) c_{t}^{2}}_{\text {ltô term }}) d t+f^{\prime}\left(X_{t}\right) c_{t} d B_{t}
$$

## Intuition: curvature creates drift!

## Intuition: curvature creates drift!

## Itô's lemma ( nD to 1D)

For $d X_{t}=u_{t} d t+C_{t} d B_{t}$ if we have $Y_{t}=f\left(X_{t}\right)$, then

$$
d Y_{t}=\left(\left\langle\nabla f\left(X_{t}\right), u_{t}\right\rangle+\frac{1}{2} \operatorname{tr}\left(C_{t}^{\top} \nabla^{2} f\left(X_{t}\right) C_{t}\right)\right) d t+\left\langle\nabla f\left(X_{t}\right), C_{t} d B_{t}\right\rangle
$$

## Stochastic localization

For $\mu$ on subset of $\mathbb{R}^{n}$, and adapted matrix process $C_{t}$, we define $\forall x$

$$
\mathrm{d} \mu_{\mathrm{t}}(x)=\left\langle x-\operatorname{mean}\left(\mu_{\mathrm{t}}\right), \mathrm{C}_{\mathrm{t}} \mathrm{~dB} \mathrm{~B}_{\mathrm{t}}\right\rangle \mu_{\mathrm{t}}(x)
$$

## Stochastic localization

For $\mu$ on subset of $\mathbb{R}^{n}$, and adapted matrix process $C_{t}$, we define $\forall x$

$$
\mathrm{d} \mu_{\mathrm{t}}(x)=\left\langle x-\operatorname{mean}\left(\mu_{\mathrm{t}}\right), \mathrm{C}_{\mathrm{t}} \mathrm{~dB} \mathrm{~B}_{\mathrm{t}}\right\rangle \mu_{\mathrm{t}}(x)
$$

$D$ For continuous $\mu$, we should think of it as density. You can for simplicity assume support is finite.

## Stochastic localization

For $\mu$ on subset of $\mathbb{R}^{n}$, and adapted matrix process $C_{t}$, we define $\forall x$

$$
\mathrm{d} \mu_{\mathrm{t}}(x)=\left\langle x-\operatorname{mean}\left(\mu_{\mathrm{t}}\right), \mathrm{C}_{\mathrm{t}} \mathrm{~dB} \mathrm{~B}_{\mathrm{t}}\right\rangle \mu_{\mathrm{t}}(\mathrm{x})
$$

$D$ For continuous $\mu$, we should think of it as density. You can for simplicity assume support is finite.
$D$ It is a martingale, with filtration $\mathcal{F}_{\mathrm{t}}$ :

$$
\mathbb{E}\left[\mu_{\mathrm{t}}(x) \mid \mathcal{F}_{\mathrm{s}}\right]=\mu_{\mathrm{s}}(x) \quad \forall \mathrm{s} \leqslant \mathrm{t}
$$

## Stochastic localization

For $\mu$ on subset of $\mathbb{R}^{n}$, and adapted matrix process $C_{t}$, we define $\forall x$

$$
\mathrm{d} \mu_{\mathrm{t}}(x)=\left\langle x-\operatorname{mean}\left(\mu_{\mathrm{t}}\right), \mathrm{C}_{\mathrm{t}} \mathrm{~dB} \mathrm{~B}_{\mathrm{t}}\right\rangle \mu_{\mathrm{t}}(x)
$$

$D$ For continuous $\mu$, we should think of it as density. You can for simplicity assume support is finite.
$D$ It is a martingale, with filtration $\mathcal{F}_{\mathrm{t}}$ :

$$
\mathbb{E}\left[\mu_{\mathrm{t}}(\mathrm{x}) \mid \mathcal{F}_{\mathrm{s}}\right]=\mu_{\mathrm{s}}(\mathrm{x}) \quad \forall \mathrm{s} \leqslant \mathrm{t}
$$

$\bigcirc$ If $\mu$ is normalized, $\mu_{\mathrm{t}}$ remains so:

$$
\begin{aligned}
& \mathrm{d}\left(\sum_{x} \mu_{\mathrm{t}}(x)\right)=\left\langle\sum_{x} \mu_{\mathrm{t}}(x)(x-\right. \\
& \left.\left.\quad \operatorname{mean}\left(\mu_{\mathrm{t}}\right)\right), C_{\mathrm{t}} \mathrm{~d} B_{\mathrm{t}}\right\rangle=0
\end{aligned}
$$

## Stochastic localization

For $\mu$ on subset of $\mathbb{R}^{n}$, and adapted matrix process $C_{t}$, we define $\forall x$

$$
\mathrm{d} \mu_{\mathrm{t}}(\mathrm{x})=\left\langle\mathrm{x}-\operatorname{mean}\left(\mu_{\mathrm{t}}\right), \mathrm{C}_{\mathrm{t}} \mathrm{~dB} B_{\mathrm{t}}\right\rangle \mu_{\mathrm{t}}(\mathrm{x})
$$

$D$ For continuous $\mu$, we should think of it as density. You can for simplicity assume support is finite.
$\bigcirc$ It is a martingale, with filtration $\mathcal{F}_{\mathrm{t}}$ :

$$
\mathbb{E}\left[\mu_{\mathrm{t}}(x) \mid \mathcal{F}_{\mathrm{s}}\right]=\mu_{\mathrm{s}}(x) \quad \forall \mathrm{s} \leqslant \mathrm{t}
$$

$D$ If $\mu$ is normalized, $\mu_{\mathrm{t}}$ remains so:

$$
\begin{aligned}
& \mathrm{d}\left(\sum_{x} \mu_{\mathrm{t}}(x)\right)=\left\langle\sum_{x} \mu_{\mathrm{t}}(x)(x-\right. \\
& \left.\left.\quad \operatorname{mean}\left(\mu_{\mathrm{t}}\right)\right), C_{\mathrm{t}} \mathrm{~d} B_{\mathrm{t}}\right\rangle=0
\end{aligned}
$$

$D$ Changes in $\mu_{\mathrm{t}}$ are proportional to itself. Log-scale? Let's use Itô's lemma for $\mathrm{f}=\log$.

## Stochastic localization

For $\mu$ on subset of $\mathbb{R}^{n}$, and adapted matrix process $C_{t}$, we define $\forall x$

$$
\mathrm{d} \mu_{\mathrm{t}}(x)=\left\langle x-\operatorname{mean}\left(\mu_{\mathrm{t}}\right), \mathrm{C}_{\mathrm{t}} \mathrm{~dB} B_{\mathrm{t}}\right\rangle \mu_{\mathrm{t}}(x)
$$

$D$ For continuous $\mu$, we should think of it as density. You can for simplicity assume support is finite.
$D$ It is a martingale, with filtration $\mathcal{F}_{\mathrm{t}}$ :

$$
\mathbb{E}\left[\mu_{\mathrm{t}}(x) \mid \mathcal{F}_{s}\right]=\mu_{\mathrm{s}}(x) \quad \forall \mathrm{s} \leqslant \mathrm{t}
$$

$\bigcirc$ If $\mu$ is normalized, $\mu_{\mathrm{t}}$ remains so:

$$
\begin{aligned}
& \mathrm{d}\left(\sum_{x} \mu_{\mathrm{t}}(x)\right)=\left\langle\sum_{x} \mu_{\mathrm{t}}(x)(x-\right. \\
& \left.\left.\quad \operatorname{mean}\left(\mu_{\mathrm{t}}\right)\right), \mathrm{C}_{\mathrm{t}} \mathrm{~dB}_{\mathrm{t}}\right\rangle=0
\end{aligned}
$$

D Changes in $\mu_{\mathrm{t}}$ are proportional to itself. Log-scale? Let's use Itô's lemma for $\mathrm{f}=\log$.
$\checkmark$ If $X_{t}=\mu_{t}(x)$, and $Y_{t}=\log \left(X_{t}\right)$, then $d Y_{t}=$ $\left\langle x-\operatorname{mean}\left(\mu_{t}\right), C_{t} \mathrm{~dB}_{\mathrm{t}}\right\rangle+($ Itô term $) \mathrm{dt}$ where Itô term is

$$
\frac{-\left(x-\operatorname{mean}\left(\mu_{t}\right)\right)^{\top} C_{t} C_{t}^{\top}\left(x-\operatorname{mean}\left(\mu_{t}\right)\right) \cdot X_{t}^{2}}{2 X_{t}^{2}}
$$

## Stochastic localization

For $\mu$ on subset of $\mathbb{R}^{n}$, and adapted matrix process $C_{t}$, we define $\forall x$

$$
\mathrm{d} \mu_{\mathrm{t}}(\mathrm{x})=\left\langle\mathrm{x}-\operatorname{mean}\left(\mu_{\mathrm{t}}\right), \mathrm{C}_{\mathrm{t}} \mathrm{~dB} B_{\mathrm{t}}\right\rangle \mu_{\mathrm{t}}(\mathrm{x})
$$

$D$ For continuous $\mu$, we should think of it as density. You can for simplicity assume support is finite.
$D$ It is a martingale, with filtration $\mathcal{F}_{\mathrm{t}}$ :

$$
\mathbb{E}\left[\mu_{\mathrm{t}}(\mathrm{x}) \mid \mathcal{F}_{\mathrm{s}}\right]=\mu_{\mathrm{s}}(\mathrm{x}) \quad \forall \mathrm{s} \leqslant \mathrm{t}
$$

$D$ If $\mu$ is normalized, $\mu_{\mathrm{t}}$ remains so:

$$
\begin{aligned}
& \mathrm{d}\left(\sum_{x} \mu_{\mathrm{t}}(x)\right)=\left\langle\sum_{x} \mu_{\mathrm{t}}(x)(x-\right. \\
& \left.\left.\quad \operatorname{mean}\left(\mu_{\mathrm{t}}\right)\right), \mathrm{C}_{\mathrm{t}} \mathrm{~dB}_{\mathrm{t}}\right\rangle=0
\end{aligned}
$$

$D$ Changes in $\mu_{\mathrm{t}}$ are proportional to itself. Log-scale? Let's use Itô's lemma for $\mathrm{f}=\log$.
$D$ If $X_{t}=\mu_{t}(x)$, and $Y_{t}=\log \left(X_{t}\right)$, then $d Y_{t}=$ $\left\langle x-\operatorname{mean}\left(\mu_{t}\right), C_{t} \mathrm{~dB}_{\mathrm{t}}\right\rangle+($ Itô term $) \mathrm{dt}$ where Itô term is

$$
\frac{-\left(x-\operatorname{mean}\left(\mu_{t}\right)\right)^{\top} C_{t} C_{t}^{\top}\left(x-\operatorname{mean}\left(\mu_{t}\right)\right) \cdot X_{t}^{2}}{2 X_{t}^{2}}
$$

$D$ So if we name $\Sigma_{t}=C_{t} C_{t}^{\top}$, then $d \log \mu_{t}(x)=-\frac{1}{2} x^{\top} \Sigma_{t} x d t+\operatorname{affine}(x)$

## Stochastic localization

For $\mu$ on subset of $\mathbb{R}^{n}$, and adapted matrix process $C_{t}$, we define $\forall x$

$$
\mathrm{d} \mu_{\mathrm{t}}(x)=\left\langle x-\operatorname{mean}\left(\mu_{\mathrm{t}}\right), \mathrm{C}_{\mathrm{t}} \mathrm{~dB} B_{\mathrm{t}}\right\rangle \mu_{\mathrm{t}}(x)
$$

$D$ For continuous $\mu$, we should think of it as density. You can for simplicity assume support is finite.
$D$ It is a martingale, with filtration $\mathcal{F}_{\mathrm{t}}$ :

$$
\mathbb{E}\left[\mu_{\mathrm{t}}(x) \mid \mathcal{F}_{s}\right]=\mu_{s}(x) \quad \forall s \leqslant t
$$

$D$ If $\mu$ is normalized, $\mu_{\mathrm{t}}$ remains so:

$$
\begin{aligned}
& \mathrm{d}\left(\sum_{x} \mu_{\mathrm{t}}(x)\right)=\left\langle\sum_{x} \mu_{\mathrm{t}}(x)(x-\right. \\
& \left.\left.\quad \operatorname{mean}\left(\mu_{\mathrm{t}}\right)\right), \mathrm{C}_{\mathrm{t}} \mathrm{~d} \mathrm{~B}_{\mathrm{t}}\right\rangle=0
\end{aligned}
$$

$D$ Changes in $\mu_{\mathrm{t}}$ are proportional to itself. Log-scale? Let's use Itô's lemma for $\mathrm{f}=\log$.
$D$ If $X_{t}=\mu_{t}(x)$, and $Y_{t}=\log \left(X_{t}\right)$, then $d Y_{t}=$ $\left\langle x-\operatorname{mean}\left(\mu_{t}\right), C_{t} \mathrm{~dB}_{\mathrm{t}}\right\rangle+($ Itô term $) \mathrm{dt}$ where Itô term is

$$
\frac{-\left(x-\operatorname{mean}\left(\mu_{t}\right)\right)^{\top} C_{t} C_{t}^{\top}\left(x-\operatorname{mean}\left(\mu_{t}\right)\right) \cdot X_{t}^{2}}{2 X_{t}^{2}}
$$

$D$ So if we name $\Sigma_{t}=C_{t} C_{t}^{\top}$, then $d \log \mu_{t}(x)=-\frac{1}{2} x^{\top} \Sigma_{t} x d t+\operatorname{affine}(x)$
$\bigcirc$ At any time $t$, we have $\mu_{t}(x) \propto$

$$
\mu(x) \cdot \exp \left(-\frac{1}{2} x^{\top} A_{t} x+\left\langle h_{t}, x\right\rangle\right)
$$

where $A_{t}=\int_{0}^{t} \Sigma_{s} d s$.

## Multiplying by Gaussian density:

Remark: this process, up to scale/time, same as how diffusion models sample.

- If we prove

$$
\mathbb{E}\left[\operatorname{Ent}_{\mu^{\prime}}^{\phi}[\mathrm{f}]\right] \geqslant \gamma \cdot \operatorname{Ent}_{\mu}^{\phi}[\mathrm{f}]
$$

we get to conclude $\rho \geqslant \gamma \cdot \rho^{\prime}$.

## Approximate conservation [Chen-Eldan]

$D$ Suppose we have a discrete/continuous time localization scheme $\left\{\mu_{t}\right\}$.

## Approximate conservation [Chen-Eldan]

$\triangleright$ Suppose we have a discrete/continuous time localization scheme $\left\{\mu_{\mathrm{t}}\right\}$.
$\triangleright$ Approximate conservation: at every step Ent ${ }_{\mu_{t}}^{\phi}[f]$ does not shrink by much on average.

## Approximate conservation [Chen-Eldan]

$\triangleright$ Suppose we have a discrete/continuous time localization scheme $\left\{\mu_{t}\right\}$.
D Approximate conservation: at every step Ent $\mu_{t}^{\phi}[f]$ does not shrink by much on average.

- In discrete time

$$
\mathbb{E}\left[\operatorname{Ent}_{\mu_{t+1}}^{\phi}[f] \mid \mathcal{F}_{t}\right] \geqslant\left(1-\alpha_{t}\right) \operatorname{Ent}_{\mu_{t}}^{\phi}[f]
$$

## Approximate conservation [Chen-Eldan]

$D$ Suppose we have a discrete/continuous time localization scheme $\left\{\mu_{t}\right\}$.
$\triangleright$ Approximate conservation: at every step Ent ${ }_{\mu_{t}}^{\phi}[f]$ does not shrink by much on average.
$\bigcirc$ In discrete time

$$
\mathbb{E}\left[\operatorname{Ent}_{\mu_{t+1}}^{\phi}[f] \mid \mathcal{F}_{t}\right] \geqslant\left(1-\alpha_{t}\right) \operatorname{Ent}_{\mu_{t}}^{\phi}[f]
$$

- In continuous time

$$
\mathbb{E}\left[\mathrm{d} \operatorname{Ent}_{\mu_{t}}^{\phi}[f] \mid \mathcal{F}_{t}\right] \geqslant-\alpha_{\mathrm{t}} \operatorname{Ent}_{\mu_{\mathrm{t}}}^{\phi}[f] \mathrm{dt}
$$

## Approximate conservation [Chen-Eldan]

$D$ Suppose we have a discrete/continuous time localization scheme $\left\{\mu_{t}\right\}$.
$\triangleright$ Approximate conservation: at every step Ent $\mu_{\mu_{t}}^{\phi}[f]$ does not shrink by much on average.

- In discrete time

$$
\mathbb{E}\left[\operatorname{Ent}_{\mu_{t+1}}^{\phi}[f] \mid \mathcal{F}_{t}\right] \geqslant\left(1-\alpha_{t}\right) \operatorname{Ent}_{\mu_{t}}^{\phi}[f]
$$

- In continuous time

$$
\mathbb{E}\left[\mathrm{dEnt}_{\mu_{t}}^{\phi}[f] \mid \mathcal{F}_{t}\right] \geqslant-\alpha_{\mathrm{t}} \operatorname{Ent}_{\mu_{t}}^{\phi}[f] \mathrm{dt}
$$

$D$ Then we get to transfer contraction rates on $\mu_{\mathrm{t}}$ to contraction rates on $\mu$ with loss:

$$
\gamma \geqslant\left(1-\alpha_{0}\right)\left(1-\alpha_{1}\right) \cdots\left(1-\alpha_{t-1}\right) \quad \text { or } \quad \gamma \geqslant \exp \left(-\int_{0}^{t} \alpha_{s} d s\right)
$$

## Approximate conservation of variance

$D$ Let us specialize to $\mathrm{Ent}^{\Phi}=$ Var and stochastic localization $\leftarrow$ works for discrete too

$$
\mathrm{d} \mu_{\mathrm{t}}(\mathrm{x})=\left\langle\mathrm{C}_{\mathrm{t}} \mathrm{~dB} \mathrm{~B}_{\mathrm{t}}, \mathrm{x}-\operatorname{mean}\left(\mu_{\mathrm{t}}\right)\right\rangle \mu_{\mathrm{t}}(\mathrm{x}) .
$$

## Approximate conservation of variance

$\checkmark$ Let us specialize to $\mathrm{Ent}^{\Phi}=$ Var and stochastic localization $\leftarrow$ works for discrete too

$$
\mathrm{d} \mu_{\mathrm{t}}(\mathrm{x})=\left\langle\mathrm{C}_{\mathrm{t}} \mathrm{~dB}, \mathrm{t}, \mathrm{mean}\left(\mu_{\mathrm{t}}\right)\right\rangle \mu_{\mathrm{t}}(x)
$$

$\bigcirc$ We have $\mathbb{E}_{\mu_{t}}\left[\mathrm{f}^{2}\right]$ and $\mathbb{E}_{\mu_{t}}[f]$ are both martingales. Evolution:

$$
d \mathbb{E}_{\mu_{t}}[f]=\sum_{x}\left\langle C_{t} d B_{t}, x-\operatorname{mean}\left(\mu_{t}\right)\right\rangle \mu_{t}(x) f(x)=\left\langle C_{t} d B_{t}, v_{t}\right\rangle
$$

for the vector $\nu_{t}=\mathbb{E}_{x \sim \mu_{t}}\left[f(x)\left(x-\operatorname{mean}\left(\mu_{t}\right)\right)\right]$.

## Approximate conservation of variance

$\checkmark$ Let us specialize to $\mathrm{Ent}^{\Phi}=$ Var and stochastic localization:- works for discrete too

$$
\mathrm{d} \mu_{\mathrm{t}}(\mathrm{x})=\left\langle\mathrm{C}_{\mathrm{t}} \mathrm{~dB}, \mathrm{t}, \operatorname{mean}\left(\mu_{\mathrm{t}}\right)\right\rangle \mu_{\mathrm{t}}(x)
$$

$\bigcirc$ We have $\mathbb{E}_{\mu_{t}}\left[\mathrm{f}^{2}\right]$ and $\mathbb{E}_{\mu_{\mathrm{t}}}[\mathrm{f}]$ are both martingales. Evolution:

$$
d \mathbb{E}_{\mu_{t}}[f]=\sum_{x}\left\langle C_{t} d B_{t}, x-\operatorname{mean}\left(\mu_{t}\right)\right\rangle \mu_{t}(x) f(x)=\left\langle C_{t} d B_{t}, v_{t}\right\rangle
$$

for the vector $\nu_{t}=\mathbb{E}_{x \sim \mu_{t}}\left[f(x)\left(x-\operatorname{mean}\left(\mu_{t}\right)\right)\right]$.
$\bigcirc$ This means that

$$
\mathrm{d} \operatorname{Var}_{\mu_{\mathrm{t}}}[\mathrm{f}]=(\text { martingale term })-v_{\mathrm{t}}^{\top} \Sigma_{\mathrm{t}} v_{\mathrm{t}} \mathrm{dt}
$$

## Approximate conservation of variance

$D$ Let us specialize to $\mathrm{Ent}^{\Phi}=$ Var and stochastic localization $\leftarrow$ works for discrete too

$$
\mathrm{d} \mu_{\mathrm{t}}(\mathrm{x})=\left\langle\mathrm{C}_{\mathrm{t}} \mathrm{~dB}, \mathrm{t}, \operatorname{mean}\left(\mu_{\mathrm{t}}\right)\right\rangle \mu_{\mathrm{t}}(\mathrm{x})
$$

$\bigcirc$ We have $\mathbb{E}_{\mu_{\mathrm{t}}}\left[\mathrm{f}^{2}\right]$ and $\mathbb{E}_{\mu_{\mathrm{t}}}[\mathrm{f}]$ are both martingales. Evolution:

$$
d \mathbb{E}_{\mu_{t}}[f]=\sum_{x}\left\langle C_{t} d B_{t}, x-\operatorname{mean}\left(\mu_{t}\right)\right\rangle \mu_{t}(x) f(x)=\left\langle C_{t} d B_{t}, v_{t}\right\rangle
$$

for the vector $\nu_{t}=\mathbb{E}_{x \sim \mu_{t}}\left[f(x)\left(x-\operatorname{mean}\left(\mu_{t}\right)\right)\right]$.
$\checkmark$ This means that

$$
\mathrm{d} \operatorname{Var}_{\mu_{\mathrm{t}}}[\mathrm{f}]=(\text { martingale term })-v_{\mathrm{t}}^{\top} \Sigma_{\mathrm{t}} v_{\mathrm{t}} \mathrm{dt}
$$

$D$ As long as $\Sigma_{t}$ and $v_{\mathrm{t}}$ are orthogonal, we get that $\operatorname{Var}_{\mu_{t}}[f]$ is a martingale! $;$
